

ExchangeDefender v3.1

ExchangeDefender Release Announcement

Covers ExchangeDefender v3.1

Total mail management, security, failover and business continuity solution.

Own Web Now Corp Launching ExchangeDefender v3.1 on Monday, August 6th, 2007

After six months in beta testing and countless improvements in the areas of security, management, failover and business continuity, we are proud to present you with ExchangeDefender v3.1. The demand for ExchangeDefender during the past year has grown by an astonishing rate, in no small part due to the continuing need to manage and secure email before it reaches your network. The single most vocal demand you've given us is to provide you with more mail management capabilities in the cloud. We have heard you loud and clear: you want to stop worrying about managing your mail problems but also want the intelligence, monitoring and policy management systems to know what your mail system is used for.

After six months of development, I am proud to say on behalf of my team at Own Web Now that we are delivering all that you have asked for and more with this release of ExchangeDefender.

Sincerely,

Vladimir Mazek

CEO, Own Web Now Corp

ExchangeDefender™

Areas of Enhancement

ExchangeDefender has been improved in nearly every area of service along with a new feature which clearly separates us from other similar products on the market. These features were developed based on the feedback of our customers and partners so keep on telling us what we can do better!

LiveArchive - Business continuity with respect to communications has never been easier. LiveArchive transparently copies inbound messages to a live webmail server that you can access 24/7, securely from any computer with web access. Even if your get locked out of your mailbox, if the mail server is down, even if there are issues with the Internet connection you will still be able to access last seven (7) days of email via friendly and secure web interface.

Custom Domain Signatures - One of the most demanded features has been providing consistent corporate identity on outgoing email. Furthermore, most countries and professions now mandate disclaimers, corporate registration numbers and other information in the footer. ExchangeDefender now supports custom message signatures, both plain text and rich text / HTML.

Attachment Policies and File Sharing - ExchangeDefender now allows for granular customizable attachment screening policies. ExchangeDefender now also features a web sharing service built into it for users exchanging larger files or complex file types. If an attachment is rejected due to the security policy the remote sender will be allowed to use a web form to upload the document and allow the recipient to access the attachment via the web. This will help control the spread of viruses as well as keep the storage quotas in place.

Complete Branding - ExchangeDefender is now completely brandable, including the daily and intraday reports, web console as well as welcome messages. You can also use your own domain and SSL certificates to completely rebrand the experience (additional charges apply)

Improved Reporting - ExchangeDefender reporting has been improved to help you see the value of all the services delivered as well as additional monitoring. ExchangeDefender now integrates with Connectwise for automatic statistical synchronization. Web interface provides additional reporting features so you can see all the inbound and outbound mail, spam and legitimate, helping you track message delivery problems in the cloud.
